

COLOR INFUSED PRESSURE TREATING PROCESS

MICROSHADES COLOR INFUSED PRESSURE TREATED FENCING

Get the rich look of cedar at a fraction of the cost with MicroShades color infused pressure treated wood fencing.

MicroShades is the only pigmented colorant system that is used in-solution to fully penetrate the wood fiber, providing protection from foreign agents like termites and rot, while giving the wood a deep brown hue similar to natural cedar.

Readily available in pickets and matching components, MicroShades provides a great solution to rising cedar costs and tight availability as well as customers who want the beauty of a colored wood fence without the cost and maintenance of painting or staining.

We have seen a lot of growth with the MicroShades category this year. MicroShades is the perfect in-between product for cedar and treated.

- Satisfied MicroShades Retailer

Available products:

11/16" x 6" - 6' Premium Rough Sawn Dog Eared Pickets

2" x 4" - 8' Matching Back Rails

4" x 4" - 8' & 10' Matching Posts

Pre-built panels also available

MicroShades is a pressure treated wood product. Like all wood products, MicroShades pickets will move, shrink and even swell depending on weathering and moisture content in each picket which may cause inconsistent picket spacing. The color of individual pickets may vary from light reddish brown to dark reddish brown and some may have color striping near the heartwood which is completely normal. MicroShades is treated with micronized copper preservatives, which help protect against termite damage and fungal decay. MicroShades is covered by a 2-year stain and fade warranty.

NATURAL COLOR VARIATION OF REAL WOOD

2 YEAR COLOR WARRANTY

COLOR DEEPENS WITH SUN EXPOSURE

MicroShades has done really well for us. It looks a lot like cedar, and since cedar pricing has gone through the roof, MicroShades has been much more affordable for homeowners. We haven't had any installation issues with it either; overall it's been a great product.

- Experienced MicroShades Installer

The MicroShades color treatment process is the first treated wood process to be certified under Scientific Certification Systems Environmentally Preferable Product (EPP) program based on Life-Cycle Assessment. It also meets the stringent standards for low volatile organic compound (VOC) emissions and is approved for points toward National Green Building Certification.
